

FULL STACK DEVELOPER

Hello, thank you for applying to our **Full Stack (React + Node) Developer** opening 😊. We conduct a code test to see your skills, professional experience and best practices first handed. Read the instructions and once you have finished your test, our technical team will review it and share their feedback.

📌 Important details

- You have a maximum of **72 hours** to complete the exercise.
- Remember to share the **public repository** with your recruiter.
- Send a **1-minute video** on MP4 format showing your code working.
- Don't forget to include a **detailed documentation** of your code, endpoints, etc.
- If you have any questions contact: mariana.rubio@designli.co or diego.morales@designli.co

📌 Instructions:

- You can choose either of the two exercises. **Follow the instructions** and if you want to propose something else, you have room to unleash your creativity and tech experience 👍.

The easy one:

1. Develop a **full-stack** application that allows users to book time slots while ensuring:
 - a. **Avoiding scheduling conflicts** with existing bookings in the system.
 - b. **Synchronizing with Google Calendar** to prevent booking over existing events in the user's calendar.
2. **Functional requirements**
 - a. Users login using Google.
 - b. Users can book time slots (Name of the booking, start time and end time)
 - c. Users can view their booked slots and cancel them.
 - d. Users cannot book a time slot if it conflicts with:
 - i. An existing booking in the system.
 - ii. An event in their Google Calendar.
 - e. Users can connect their Google Calendar and allow the app to check for conflicts.
 - f. The system should check Google Calendar before confirming a booking.

The real challenge:

1. Extend the previous setup by configuring Docker for the deployment.
2. Use Postgres instead of SQLite
3. Use Auth0 for authentication

Thank you for your time invested in our selection process. Our team will review your test as soon as possible.

FULL STACK DEVELOPER

TECHNICAL REQUIREMENTS:

Backend (Nest.js)

1. Create a **NestJS API** that handles:
 - a. User authentication (JWT-based).
 - b. Booking creation, validation, and storage.
 - c. Google Calendar API integration to check for conflicts.
2. Implement SQLite and Prisma to store users and bookings.

Frontend (React.js + Next.js)

1. Create a **Next.js** application that allows users to:
 - a. Log in using Google
 - b. View available slots and book or cancel them.
 - c. Connect their Google Calendar.
2. Use **Tailwind CSS** or **Material UI** for UI components.

✦ Final Details:

- If you need more time to complete the deliverables notify your recruiter.
- If your test has been approved and you need to reschedule the technical interview, notify your Recruiter at least **one hour before the meeting**.
 - Sessions may be rescheduled up to two times; otherwise, the selection process will be suspended.

Thank you for your time invested in our selection process. Our team will review your test as soon as possible.
